## 2. Core Competences

ProteoSys is a commercial research institution, which since the foundation has a strong focus on protein biomarkers and systems biology. In our laboratories we have established cutting edge technologies for proteomic analyses (mass spectrometry and isotopic labeling techniques) and high-end cell biology (stem cell-based in vitro systems). We participate in many cooperative research projects with industrial or academic partners, the majority within large European Projects (Framework Programs FP5-FP7). Currently we are part of four FP7-projects (Info: [www.proteosys.com](http://www.proteosys.com)).

We have used the results of these activities to build a strong patent portfolio in the fields of neurobiology, toxicology and cancer research. Currently three out-licensed products are in preclinical or clinical development.

## 3. Cooperations offered and requested

The types of our cooperation models with industrial partners is manifold: It is ranging from service for fee contracts, where we are CRO to complex collaborations with licensees where we work together on certain preclinical or clinical stages with the aim of market development of diagnostic (prostate cancer) or therapeutic (neurobiology) products.
